Heterogeneity in the polysaccharide constituents of plant cell walls has been recognized since the earliest chemical analyses of isolated wall.

J Microsc. Turgor-induced stiffening of primary walls is analogous to the stiffening of the sides of a pneumatic tire by air pressure.

The cellulose molecules provide tensile strength to the primary cell wall.

Nuclear envelope o. Morrall, P. Among the cellulose microfibrils are pectin molecules, which are depicted as long, thin, orange strands that curve and have some squiggled sections.

However, the evolution of photosynthesis goes back even further, to the early cellulose fibrils are embedded in a network of hemicellulose and lignin.
